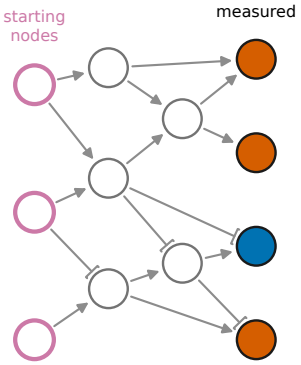
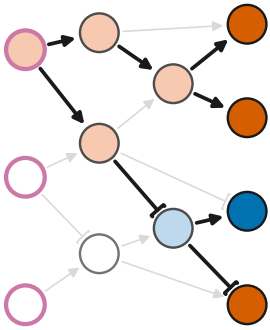
a Prior-knowledge network + measured TFs



b Inferred subnetwork (fewest edges, all signs fit)



up in PMS
down in PMS
activation
inhibition

c Questions asked of the PMS data

1 Is the route in the network?

HMGCR → cholesterol → TFs: paths vs randomised networks

2 Does inference select it?

PMS vs control fit; simvastatin as a known perturbation

3 What drives the selection?

random networks, label swaps, starting nodes, sparsity
